## A Development of Electropia system for CALS/EC Implementation in Electronic Industry

### Abstract

The Electropia is a CALS/EC engine developed by the Korea CALS/EC Association composed of the government, several universities, and many small and big companies in Korea, in order to develop and procure standard public parts, support electronic commerce, and make use of internet shopping mall and technical information owned in common. The Electropia system is a practical model based on up-to-date CALS/EC technologies to support major Korean Electronic Manufacturers to cooperate in designing, purchasing and marketing processes. With this system, they could develop common parts, enhance their logistics and procurement capability, and provide more convenience to customers in their buying processes. This system is expected to raise the productivity and reduce material and marketing cost, which will essentially help to strengthen the competitiveness of Korean Electronic Industries in international marketing .
